

5

What is claimed is:

1. A laptop computer comprising:

- (a) a computer case including a keyboard and containing computer components;
 - (b) a first display screen hingedly secured to said case and connected to said computer components for displaying information, when in an operative position, to an operator positioned at said keyboard; and
 - (c) a second display screen, substantially the same size as said first display screen, connected to said computer components for displaying said information, when in an operative position, said second display screen being slidably and rotatably connected to said first display screen such that said second display screen is adjustable between a first position in which said second display screen is behind said first display screen and facing substantially in said first direction, and a second position in which said second display screen is facing in a second direction between 90° and 180° from said first direction such that in said second position an operator at said keyboard may view said first display screen and an observer, facing said operator, may simultaneously view said second display screen.
2. The combination set forth in claim 1 including a single protective cover hingedly secured to said computer case for enclosing and protecting said first and second display screens when not in use.
3. A laptop computer comprising:
- (a) a computer case including a keyboard and containing computer components;
 - (b) a first display screen facing a first direction, said first display screen having a rectangular shape and having a bottom and top edge joined by side edges, said first display screen hingedly secured to said case along said bottom edge and connected to said computer components for displaying information to an operator positioned at said keyboard;
 - (c) a second display screen having a rectangular shape with bottom and top edges joined by side edges, said second display screen hingedly secured to said first display screen at the top edges of said display screens and movably secured to said first display screen such that said second display screen is adjustable between a first position wherein said top edge of said second display screen is adjacent said bottom edge of said first display screen and said second display screen is behind said first display screen and facing substantially in said first direction, and a second position in which said top edge of said second display screen is adjacent said top edge of said first display screen and said second display screen is facing in a second direction between 90° and 180° from said first direction such that in said second position an operator at said keyboard may view said first display screen and an observer, facing said

6

operator, may simultaneously view said second display screen, said first and second display screens displaying substantially the same information.

4. The combination set forth in claim 3 wherein said first display screen includes channels extending along its side edges and including means connected to said second display screen for movably extending along said channels to thereby permit the first and second display screens to be moved relative to each other.

5. A laptop computer comprising:

- (a) a case including a keyboard and at least partially containing computer components;
- (b) a first display screen hingedly secured to said case at a first edge of said first display screen, operably coupled to said computer components, and configured to display information when in an operative position, the first display screen having:
 - 1) a second edge substantially parallel to said first edge and joined thereto by first and second sides having lengths; and
 - 2) a channel extending a majority of said length of each of said first and second sides;
- (c) a second display screen operably coupled to said computer components and configured to display at least a portion of said information displayed on said first display screen when in an operative position, the second display screen having:
 - 1) a display surface;
 - 2) first and second rollers each extending adjacent said first edge from said first and second sides, respectively, said first and second rollers each being slidably and rotatably associated with an operatively associated channel of said first display screen such that said second display screen is adjustable between a first position with an angle of approximately 180° between the first and second display screens, and a second position with an angle of between approximately 225° and 360° between the first and second display screens such that in said second position an operator at said keyboard may view said first display screen and an observer, facing said operator, may simultaneously view said second display screen.

6. The laptop computer of claim 5, further including a single protective cover hingedly secured to said case enclosing and protecting said first and second display screens when not in use.

7. The laptop computer of claim 5, wherein said second display screen is configured to display less than all of said information displayed on said first display screen.

8. The laptop computer of claim 5, wherein said second display screen is configured to display only information selected by an operator of said laptop computer.
